**HOLOCOM NETWORKS ANNOUNCES REDESIGN  
OF PROTECTIVE DISTRIBUTION SYSTEM (PDS) COMPONENT**

*Customer Feedback Leads to Labor-saving Improvement*

**(Carlsbad, CA – September 27, 2007)** Holocom Networks, a leading provider of secure communications enclosures and raceway products, today announced its newest product improvement for Secure PathWay™, a patented protective distribution system (PDS) that provides physical security for SIPRNet, JWICS and all other classified networks (C-LAN).

The product improvement consists of changing the square flange in the interface sleeve (INF) to a round flange. The INF is used to transition the secure raceway to an enclosure or a through-wall kit. The new round flange completely covers the penetration hole and eliminates the need to align an additional part previously used for ensuring aesthetics. By changing the design of this one component in the INF, there are fewer parts and improved installation efficiency, all while maintaining the full security of the PDS.

“The design change of the INF is a direct result of feedback from our network of installers. Holocom is proud to foster an ethic of open communication that results in an improvement such as this,” said John M. Burns, president and CEO of Holocom Networks. “The system was originally designed from an installer’s perspective, and that tradition carries forward with this change.”
